GLOBAL CAPITALISM INDEX TEAM

The Global Capitalism Index is developed by the Democracy & Capitalism Lab at the University of Virginia, in partnership with the Institute for Business in Society at the Darden School of Business.

The Democracy & Capitalism Lab is a multidisciplinary team of faculty and experts focused on studying the intersection of democracy and capitalism.

THE DEMOCRACY & CAPITALISM LAB

WHAT IS THE GLOBAL CAPITALISM INDEX?

The Global Capitalism Index (GCI) provides a new theory and quantitative model of capitalism. The GCI is comprised of **213 datasets** across **33 domains**, and **8 independent subindices**. We compile and weight all datasets from **2009 to 2025** via an adaptive principal components analysis (PCA) methodology covering a total of **175 countries**.

INTRODUCTION: THE ARCHITECTURE OF CAPITALISM

Few ideas have done more to shape the fortunes of nations than capitalism. Yet despite generations of fierce debate, we still don't have clear answers to several fundamental questions: what capitalism is, how to benchmark it, or what separates one capitalist system from another.

These questions matter a great deal, because capitalism stretches far beyond mere economics. It lays the foundations for where companies invest, how capital moves across the globe, and the conditions in which businesses compete and, hopefully, grow. It also sits behind some of the biggest arguments in public life, from inequality and democracy to corruption, taxation and human development itself.

For something so plainly influential, capitalism leaves behind an extraordinary number of unanswered questions. Does capitalism make countries richer? Does it increase inequality? Does it depend on low taxes or small government? Can it thrive without democracy? And, perhaps most fundamentally, what actually makes one capitalist system stronger than another?

Those questions are surprisingly difficult to answer, because capitalism is all too often treated as a single idea. In reality, it comes in many guises. Some capitalist economies are built around competition and entrepreneurship. Others lean more heavily on finance, trade, or strong market institutions. The complexity of real-world systems makes a deceptively simple question a devilishly difficult one: which capitalist nations are actually the most robust?

The Democracy & Capitalism Lab at the University of Virginia designed the Global Capitalism Index (GCI) to address those questions. The GCI ranks the capitalist elements of 175 countries' economies between 2009 and 2025. But that's only the starting point of this report. The GCI examines what makes capitalism tick, breaking economies down across eight dimensions, testing long-held assumptions, and uncovering four distinct varieties of capitalism.

These results have the potential to change the conversation around capitalism completely. The report

moves beyond the old argument about markets versus the state, and asks what actually makes capitalism work. The answer? Not one model, but many.

WHAT DO WE MEAN BY CAPITALISM?

Few ideas have divided economists and political theorists more than capitalism. Milton Friedman championed private property and profit. Joseph Schumpeter put entrepreneurship and innovation at the heart of the system. Adam Smith built capitalism around competition, private property and markets free from interference. Friedrich Hayek rejected the label altogether, preferring to describe a "market-based order."

Without a common definition, we can't say for sure which capitalist systems work best — or why. The Global Capitalism Index thus rests on a simple proposition:

Capitalism is a system that privileges the ability to deploy capital in open markets as freely as possible, while minimizing constraints from both public and private sources.

The GCI doesn't see capitalism merely as free markets. It sees it as the institutions that let capital move. Every part of that definition matters.

This is where the GCI breaks from established measures of economic freedom, notably the Fraser Institute's *Economic Freedom of the World* and the Heritage Foundation's *Index of Economic Freedom*. Those indices start from the idea that more government means less capitalism; the GCI doesn't. It measures capitalism itself. Governments can hold markets back. They can also strengthen them

by protecting property rights and enforcing contracts. Private actors can be just as damaging to capitalism by suppressing competition and restricting the flow of capital.

The idea that both public and private actors can impede capitalist enterprise runs through the entire index, which rests on four simple principles.

First, capitalism is a system. Markets don't just appear or sustain themselves. They rely on institutions that protect property rights, support competition, and endure over time. In the GCI, institutions do not simply correct market failures. They are fundamental to capitalism itself.

Second, capital extends beyond money. The GCI treats capital as being financial, physical and human. Capitalism therefore depends not only on the deployment of financial capital, but also on people's ability to put their experience, knowledge, and skills to productive use.

Third, capital needs open markets if it is to move freely. The efficient deployment of capital requires rules and institutions that allow people to buy, sell and compete, while prices are free to reflect supply, demand and reliable information. However, openness doesn't stop at the border. It also depends on the free movement of goods and capital, and on access to global talent so people can put their knowledge and skills to best use.

Finally, those markets need protecting. The GCI doesn't assume the biggest threats to capitalism come from governments alone. Private actors can be just as damaging through the creation of monopolies, price fixing, gatekeeping and cronyism.

The GCI turns its definition into eight institutional dimensions:

1. Strength of Property Rights and Private Ownership
2. Market-Supporting Policy
3. Labor Market Openness
4. Market Competition
5. Capital Market Sophistication
6. Depth and Stability of the Banking System
7. New Business Formation and Growth
8. Free Flow of Goods and Capital

Together, these "subindices" capture the institutional foundations of a country's capitalist system — and how well it puts capital to work.

Global Capitalism Index Score, by Subindex 2025

SUBINDEX	DOMAINS	DATASETS
1. Strength of Property Rights & Ownership	Intellectual Property Protection, Lack of Corruption, State Stability, Political Expression, Rule of Law, Contract Enforcement, Private Ownership	31
2. Market-Supporting Policy	Market Initiatives, Operational and Institutional Quality	20
3. Labor Market Openness	Labor Market Flexibility, Labor Protections, Labor Availability	13
4. Market Competition	Creative Destruction, Regulatory Analysis, Human Capital Competitiveness	31
5. Capital Market Sophistication	Access and Participation: Infrastructure, Access and Participation: Transactions, Equity Market Depth & Scope, Bond Market Depth & Scope, Venture Capital Availability, M&A Prevalence, Liquidity and Resilience	29
6. Depth & Stability of Banking System	Banking System Depth, Banking System Stability	22
7. New Business Formation & Growth	Human Capital, Cultural Acceptance of Entrepreneurship, Market Access, Access to Startup Capital, Government Supporting Policy, R&D Transfers	56
8. Free Flow of Goods & Capital	Free Flow of Trade, Free Flow of Capital, Free Flow of Human Capital	11
GLOBAL CAPITALISM INDEX		213

RANKINGS AND ANALYSIS

Switzerland tops the Global Capitalism Index with a score of 96.9. The United States, Hong Kong, and Canada follow, with Singapore completing the top five. Rounding out the top 10 are Luxembourg, Denmark, Australia, Sweden and Norway, as seen in **Figure 1**.

Yet the headline ranking only tells part of the story. The GCI captures both stability and change, with the bulk of the nations in the top 10 back in 2009 still there 16 years

later. Those are Singapore, Hong Kong, Denmark, Sweden, Switzerland, and the US. Meanwhile, Canada, Luxembourg, Norway and Australia have broken into the top tier, replacing the UK, Ireland, Finland, and the Netherlands. The result suggests the world’s strongest capitalist systems have proved remarkably resilient. Yet the leadership has not remained static, and **Figure 2** compares the top ten in 2009 and 2025.

Figure 1. 2025 Global Capitalism Index Top 10 Countries

RANKING	COUNTRY	SCORE
1	Switzerland	96.9
2	United States of America	95.0
3	Hong Kong	94.5
4	Canada	93.8
5	Singapore	93.3
6	Luxembourg	92.5
7	Denmark	91.9
8	Australia	91.6
9	Sweden	90.6
10	Norway	90.3

Figure 2. Global Capitalism Index Top 10, 2009 vs. 2025

RANKING	2009	2025
1	Singapore	Switzerland
2	Hong Kong	United States of America
3	Denmark	Hong Kong
4	Sweden	Canada
5	Switzerland	Singapore
6	United States of America	Luxembourg
7	United Kingdom	Denmark
8	Ireland	Australia
9	Finland	Sweden
10	Netherlands	Norway

The overall ranking also masks significant variation beneath the composite score. Every country is scored across eight institutional dimensions (subindices), and the leaders change from one year to the next. Switzerland ranks first overall in 2025, but Hong Kong tops three of the eight subindices: Banking System, New Business Formation and Free Flow of Goods and Capital. The US leads Capital Market Sophistication, Taiwan tops Market Competition, Luxembourg ranks first for Market-Supporting Policy, and Denmark leads Property Rights and Private Ownership.

Figure 3 breaks out the top 10 performers in each subindex. No single nation heads every subindex, showing there is more than one way to build a robust capitalist economy.

Indeed, the bigger story perhaps isn't who comes first. The key headline is that capitalism itself has been through major shifts over the past 16 years. Looking at the overall GCI performance across the 2009-2025 panel, the average score has barely changed, slipping only slightly from 64.1 in 2009 to 63.5 in 2025. However, that stability masks much bigger institutional shifts, and a growing divide beneath the surface.

10	Canada

The largest shifts, and sharpest declines, have come in global financial markets and trade. Capital Market Sophistication has fallen by 9.0 points since 2009, while Free Flow of Goods and Capital has dropped by 5.2 points. These declines reflect tighter capital controls and broader financial deglobalization after the global financial crisis. Labor Market Openness has also slipped, down 2.6 points. But the picture isn't uniformly negative: New Business Formation has risen by 3.9 points and Property Rights by 2.8 points, while Banking System has surged 10.3 points — by far the largest shift of any pillar, concentrated in the years after 2019.

The eight subindices have not moved in lockstep. Some have strengthened, others have weakened, and together they point to a capitalist structure that has been changing in very different ways beneath a relatively stable headline score.

Regional differences become particularly stark. The biggest global improvement has come from Central Asia, with its average score rising 5.0 points since 2009. East Asia and the Pacific (+2.1) and the Middle East and North Africa (+1.0) also posted gains, while Eastern Europe (−0.1) and North America (−0.4) were essentially flat.

The contrast comes with Latin America, which notched the steepest fall at 4.3 points. Western Europe also declined, dropping 4.0 points, while South Asia (−0.7) and Sub-Saharan Africa (−1.2) posted smaller losses (see **Figure 4**).

A closer examination reveals even bigger changes. Zimbabwe has improved the most since 2009, gaining 18.5 points. Algeria (+16.7) and Seychelles (+16.2) follow closely. Albania, Rwanda, Georgia, Saudi Arabia, Côte d'Ivoire, Cambodia and Gabon complete the list of the 10 biggest improvers.

Sierra Leone has suffered the worst slump, losing 23.9 points, with Venezuela close behind at −23.2. The Democratic Republic of Congo, Burkina Faso, Lebanon, Libya, Nigeria, Iran, Haiti and South Africa are also among the 10 steepest fallers.

As shown in **Figure 5**, Seychelles and Albania point to sustained institutional reform, and Georgia has enjoyed a spell of post-conflict liberalization. In contrast, Sierra Leone and the Democratic Republic of Congo illustrate a wider pattern linking conflict and governance breakdown to poorer capitalist performance. Venezuela's cumulative collapse during the Chavez and Maduro eras has left it with the lowest 2025 GCI score.

The rankings are far more than league standings. The headline table tells you who leads. The subindices, long-run trends, and country movements answer the more important “why” and “how” questions.

Figure 4. Regional Mean GCI Score Change, 2009-2025

REGION	BANK	SOPH	FLOW	LABR	COMP	PLCY	BUSI	PROP
Western Europe	79.3	58.7	69.9	68.0	85.3	79.7	66.8	86.8

Iran	53.0	−13.6
Haiti	46.4	−13.2
South Africa	75.2	−12.0

BEYOND THE RANKINGS

Two countries can post almost identical scores for completely different reasons. Break the overall score into its eight subindices and the GCI becomes a diagnostic tool.

Germany illustrates the point. It ranks 24th overall, yet its Banking System score averaged just 63.6 between 2016 and 2025, compared with 91.3 for Switzerland, 90.2 for Luxembourg and 83.5 for France. That leaves Germany well behind its Western European peers despite being Europe’s largest economy and the engine of the Eurozone.

Germany’s weakness in the Banking System subindex is striking, especially since it hosts the European Central Bank and several of the largest financial institutions on earth. Yet this score reflects the structural features of Germany’s banking system: its fragmented three-pillar structure, continued reliance on cash, prolonged exposure to negative interest rates, and legacy balance-sheet impairments dating back to the 2008-09 global financial crisis.

China demonstrates a different pattern. Its New Business Formation score rose from 58.3 in 2009 to a peak of 72.1 in 2019, before easing back into the low 60s by 2025.

Figure 6. Germany, Banking System Ranking, 2009-2025

Figure 7. China, New Business and Free Flow of Free Flow of Goods and Capital Scores, 2009-2025

Yet over the same period, China's Free Flow of Goods and Capital score slumped from 58.8 in 2009 to 48.2 in 2025 as restrictions on outbound capital tightened. The result presents a split picture: it became much easier to start a business, but far more difficult for capital to flow into and out of the country.

The GCI is designed to uncover these tensions and complexities. It doesn't just explain why countries rank differently; it shows how the same economy can change over time. Looking only at the composite GCI score, these stories would be easy to miss. Breaking the index into its component parts makes them impossible to ignore.

India presents another paradox. It is now the world's sixth-largest economy and its fastest growing. Yet oddly its capitalist system has become less open. Since 2009, India's composite GCI score has fallen 8.6 points and it has lost 30 places in the GCI rankings. These declines are driven by a sharp deterioration in Labor Market Openness, Market Competition, and Market-Supporting Policy. Increasingly rigid labor controls and deterioration in its competitive environment pose significant challenges for India moving forward. While Indian GDP continues to grow at a rapid rate, its institutional declines raise doubts about the long-term viability of that growth trajectory.

Figure 8. India, GCI Aggregate, Labor Market Openness, Market Competition, and Market-Supporting Policy Scores, 2009-2025

Events in The Gambia demonstrate the GCI’s ability to capture political shifts in smaller nations. From 1994 to January 2017, the dictatorial regime of Yahya Jammeh ruled The Gambia. From the first year of GCI coverage, 2009, to 2017, the country’s property rights subindex score ranged from 32 to 39 – flat, depressed, and largely unresponsive to modest development gains elsewhere. In 2018, after Jammeh’s fall from power, that score jumped to 49.9. This is the largest single-year gain in the entire property rights subindex. By 2025 the score had reached 58.8, nearly 20 points higher than the Jammeh-era plateau.

While the GCI did not consciously test for Jammeh’s fall, it captured the effects of that regime change: validated improvements in rule-of-law indicators, judicial independence, and expropriation-risk assessments.

Figure 9. Gambia, Property Rights and Private Ownership Scores, 2009-2025

From 2017 to 2018, the Gambia experienced the largest single-year score increase in the entire property rights subindex.

SIX BIG QUESTIONS ABOUT CAPITALISM

The Democracy & Capitalism Lab designed the GCI to measure capitalist institutions, yet it also puts some of capitalism's biggest questions to the test. Does it increase inequality? Can it coexist with democracy? Does it depend on low taxes?

The relationships reported here are correlational, not causal—they show what moves together, but do not assert which factors drive the change. Nevertheless, they provide

significant insights on the linkages between capitalism and important societal forces.

Throughout this section, r refers to the Pearson correlation coefficient. It runs from -1 to $+1$. The closer it gets to either end, the stronger the relationship. A positive number means the two variables rise together. A negative number means one rises as the other falls.

Does Capitalism Increase Inequality?

Figure 10. Capitalism and Inequality: GCI × Gini Coefficient

One of the biggest charges levelled at capitalism is that it fuels inequality. The GCI points the other way: the relationship is moderately negative ($r = -0.37$). Put simply, countries with stronger capitalist institutions tend to have lower levels of income inequality.

That doesn't mean capitalism prevents inequality. It does, however, suggest that strong property rights, competitive markets and fewer opportunities to game the system go hand in hand with more equal societies.

Is Capitalism Associated with Greater Human Development?

Figure 11. Capitalism and Well-Being: GCI × Human Development Index

Here, the relationship is one of the strongest in the entire GCI dataset ($r = 0.79$). Countries with stronger capitalist institutions enjoy longer lifespans, better education, and higher incomes.

These findings support decades of research linking strong institutions to long-run development or, in other words,

sustained improvements in living standards over time. The GCI also tracks longer lives and better education, extending the relationship well beyond economic prosperity.

Can Capitalism and Electoral Democracy Coexist?

Figure 12. Capitalism and Democracy, Part I: GCI × V-DEM Electoral Democracy Index

The evidence points that way. GCI scores rise alongside those in V-Dem's Electoral Democracy Index ($r = 0.57$). Put simply, countries with stronger capitalist institutions also tend to be more electorally democratic.

Yet the relationship breaks down in places. Singapore, Qatar, and the United Arab Emirates all combine strong

capitalist institutions with relatively little electoral democracy. Capitalism and democracy often grow together because both rest on the rule of law, limits on executive power, and checks on the abuse of power. They are not, however, the same thing.

What About Liberal Democracy?

Figure 13. Capitalism and Democracy, Part II: GCI × V-Dem Liberal Democracy Index

The relationship between capitalism and democracy strengthens once the data includes liberal institutions like the rule of law, judicial independence, and the protection of individual rights alongside electoral capacity. The GCI's correlation with V-Dem's Liberal Democracy Index climbs to 0.66 when accounting for the institutions that go along with, and support, robust electoral systems.

This makes intuitive sense: liberal democracy protects contracts, property rights, and the institutions on which markets depend. Capitalism should, and historically has, thrived in places where liberal institutions are deep and entrenched.

Are People Happier in More Capitalist Societies?

Figure 14. Capitalism and Happiness: GCI × The Happiness Index

The pattern is unmistakable here: the relationship between the GCI and the World Happiness Index ($r = 0.71$), which measures how people rate their lives overall, is one of the strongest in the report. On average, countries with high GCI scores report markedly higher levels of life satisfaction.

That doesn't prove capitalism makes people happier. It does, however, link stronger capitalist institutions to higher wellbeing.

Does Capitalism Require Low Taxes?

Figure 15. Capitalism and Taxes: GCI × Tax Burden

Perhaps the most politically charged question also produces the weakest result: the correlation between the GCI and a country's overall tax burden is just 0.31. This result means that, if anything, capitalist systems have *higher* taxes, on average, than non-capitalist countries. Now, these results are based on a relatively small sample of 74 observations and 0.31 is a weak relationship at best. Nevertheless, this finding suggests that there is little evidence that low taxes are an essential feature of capitalist systems.

The Nordic countries press the point home. They combine some of the world's highest tax-to-GDP ratios with some of its mightiest capitalist institutions. This is certainly not to say that high taxes are an absolute benefit for capitalist systems. It does suggest, however, that vital institutions like robust property rights, competitive markets and open

trade can coexist with higher tax regimes. The GCI thus points to an important conclusion: capitalism is a way of organizing an economy, not a fiscal model.

In the aggregate, these findings cut against some of the sharpest claims made about capitalism — namely that it inevitably concentrates wealth, weakens democracy, and hinges on low taxes.

On the contrary: solid capitalist institutions go hand in hand with lower inequality, higher levels of human development, and greater happiness. They also thrive in both high-tax and low-tax economies. None of this proves causation. Yet all things considered, the findings show capitalism is best understood by the institutions that sustain it, and not by any single policy, ideology, or economic outcome.

THE FOUR CAPITALISMS

So far, this report has sketched the architecture of the world's capitalist economies. It has ranked them, traced how they've evolved, and examined how they relate to wider economic and social outcomes. Now it tackles a different question: what kind of capitalist system does each country have?

Two nations can post almost identical GCI scores yet do so in completely different ways. Switzerland's capitalist system, which tops the GCI, is anchored to property rights, fluid labor markets, and vigorous competition. The United States, just behind it, excels in new business formation and market-supporting institutions. Japan organizes around large corporations and powerful financial institutions. Spain and Singapore feature robust trade, investment, and the protection of capital.

The GCI empowers users to look across its eight institutional dimensions and understand how different capitalist systems are organized. In so doing, four distinct varieties emerge:

1. Entrepreneurial Capitalism
2. Corporate Capitalism
3. Institutional Capitalism
4. Commercial Capitalism

Each variety of capitalism follows a different institutional logic with its own strengths, weaknesses, and ways of organizing markets. These varieties do not tell us *how* capitalist a country is. They tell us *what kind* of capitalism it practices.

Entrepreneurial Capitalism

This first variety lives or dies by the creation of new enterprises. Its greatest assets are new business formation, market-supporting policy, and open labor markets. Deep capital markets, cross-border capital flows, and strong property rights protections take a back seat. *Relative* weaknesses do not mean countries are deficient in particular areas. It simply means that the model as a *whole* emphasizes certain elements over others. In the case of Entrepreneurial Capitalism, the system is oriented toward

helping new companies emerge, compete, and grow.

The countries in this group show why capitalist variety and capitalist strength are not one and the same. The US, Hong Kong, Singapore, and Israel perch near the top of the GCI rankings. Yet they share the same entrepreneurial mold as the United Arab Emirates, China, Vietnam, Georgia, Saudi Arabia, and far poorer economies such as Rwanda, Mali, Zimbabwe, Cameroon, and Bangladesh. Almost everything else is unlike: wealth, politics, and levels of development. What unites them is a capitalist variety that, such as it exists, is based on entrepreneurship, a supportive policy environment, and competitive markets.

This grouping features perhaps the most surprising pairing in the GCI's varieties of capitalism model—the world's two biggest economies, the US and China. On the surface, they look very different. Yet both nations build the capitalist elements of their economic systems around competitive markets backed by active government policy.

Figure 16. Entrepreneurial Capitalism

Corporate Capitalism

Corporate capitalism sits at the opposite end of the spectrum. Where entrepreneurial capitalism backs new firms, corporate capitalism supports established companies and the financial systems that fund them. Deep capital markets and stable banks define the model.

The trade-offs are just as sharp: open labor markets, competition, market-supporting policy and new business creation all give way to banks and capital markets, which dominate the model. The emphasis shifts from entrepreneurial energy to large companies, financial muscle, and economies of scale.

Japan and South Korea set the standard here. Both have built their economies around vast corporate conglomerates — *keiretsu* in Japan and *chaebol* in South Korea — where finance and industry operate hand in glove. Malaysia, Poland, Thailand, Kuwait, and Panama follow the same playbook. France also belongs to this variety, though just barely.

The Latin American economies in this group tell a similar story. Brazil, Mexico, Guatemala, and Bolivia have relative strengths in banks and capital markets. Yet the balance tips towards established companies, and entrepreneurship struggles to break through. Competition is less intense and labor markets less open.

Figure 17. Corporate Capitalism

Institutional Capitalism

If entrepreneurial capitalism revolves around new firms and corporate capitalism coalesces around large ones, institutional capitalism rests on the rules that make markets work for either.

In this model, it's the real economy that comes first. Strong property rights and open labor markets are the priority, with competitive markets close behind and new business creation in support. Banks, capital markets, and cross-border capital flows matter too, but they don't set the pace.

These results do not mean that finance is unimportant. It just means that these nations emphasize the legal, regulatory, and competitive foundations of the economy rather than the financial system on top of them.

Switzerland leads this group, followed by Canada, Denmark, Australia, Sweden, and New Zealand. The Nordic countries bring the model into sharp focus. Sweden, Denmark, Finland and Iceland all belong here, alongside the UK, Ireland, the Netherlands, Belgium, Austria, Germany, Estonia and Lithuania. The foundations are unmistakable: strong institutions and competitive markets do the hard work while banks and capital markets play a supporting role.

Figure 18. Institutional Capitalism

The biggest surprise may be the company these countries keep. African economies sit alongside some of the world’s richest democracies in the same variety of capitalism. Botswana, Namibia, Kenya, Ghana, Senegal, Benin, and Zambia belong in the same group as Switzerland, the UK, and Australia. Switzerland and Nigeria share the same blueprint despite a 55-point gap in their overall GCI scores.

Institutional Capitalism also posts the highest average GCI score of the four types (74.2), meaning that many of the world’s strongest capitalist economies follow the same institutional blueprint.

Commercial Capitalism

The fourth variety follows a very different path. Commercial capitalism revolves around trade, investment, and protecting capital. Naturally, open trade, free-flowing capital, solid property rights, private ownership, and stable banks sit at its core. Everything else comes second. The goal is simple: attract capital, keep it moving, and keep it safe. Building new businesses, opening labor markets, and driving competition take a back seat.

Spain, Portugal, Italy, and the Czech Republic lead this group, with strong property rights and open flows of goods and capital but more rigid labor markets and less entrepreneurial energy. This model stretches far beyond

Europe—Chile, Costa Rica, Mauritius, Jamaica, and Trinidad and Tobago follow similar patterns.

The former communist economies of Central and Eastern Europe give the same account. Slovenia, Bulgaria, Latvia, Slovakia, Hungary, Romania and Croatia all put trade and investment ahead of start-up ecosystems and open labor markets. Commercial capitalism is also the most uniform of the four varieties. Its members span the narrowest range of GCI scores.

Beyond the State vs. Market Debate

Collectively, the four varieties dispel the idea that capitalism can be placed on a simple spectrum running from more government to more markets. There is no single prototype. Countries achieve capitalist performance through specific combinations of institutions. Switzerland and the United States register nearly identical GCI levels, but belong to different varieties. Others follow almost exactly the same model yet end up worlds apart — as Switzerland and Nigeria so vividly show.

This separation between shape and level can provide real analytical insight. The GCI score tells us how strongly a country’s capitalist system performs. The varieties tell us how it is assembled. Some countries may have natural endowments, geographies, or histories that favor a certain model of capitalism—forcing nations into a form of capitalism that does not suit them can, and often does, lead to disaster. Thus, having specific typologies of capitalism that fit distinct strengths and weaknesses can provide policy makers with nuanced and tailored models for systemic reform.

Figure 19. Commercial Capitalism

WHAT MAKES CAPITALISM SO STRONG?

The GCI rankings tell us which countries have the strongest capitalist systems, while the varieties show that they don't need to get there the same way. This points to the bigger question running through this report: what do the world's capitalist economies actually have in common?

The first clue stems from the structure of the index itself. The GCI weighs eight different dimensions of capitalism, all of which move closely together while painting a different part of the overall picture. Component loadings show how closely each dimension lines up with that complete picture. A loading close to 1 means the fit is extremely strong. Loadings in the GCI range from 0.677 to 0.952, meaning that every subindex — from labor market openness to property rights — contributes to the overall determination of capitalist strength.

Together, these loadings explain 73.9% of the variation in the overall GCI. This coverage presents compelling evidence that the GCI is not just a bundle of unrelated measures—it is indeed capturing the connected but distinct building blocks of capitalist economies.

Nor do those dimensions stand alone. Every pair of subindex values features a positive correlation ranging from 0.39 to 0.89. These strong relationships show that the subindex scores move together, but not in lockstep. Each tells us something the others don't, and together they capture the complex and dynamic functions that make capitalist systems work.

Some relationships jump off the page. Market Competition and New Business Formation operate hand-in-glove, with a correlation of 0.885. Market-Supporting Policy isn't far behind, correlating 0.859 with New Business Formation and 0.845 with Market Competition. Put simply, countries that make it easier to compete also tend to create more new businesses, while those with stronger market-supporting institutions also tend to foster entrepreneurship. Rather than pulling in different directions, these institutions push the economy forward.

These relationships validate the GCI's thesis that capitalism is not a collection of disparate institutions that happen to exist side by side. Property rights, competition, entrepreneurship, finance, labor markets, and trade all shape one another. Change one, and the effects ripple through the rest.

The GCI demonstrates that there is no single route to a successful capitalist economy. Some countries lean harder on competition. Others start with finance, trade, or support for markets. Countries must shape their mix of capitalist institutions to best complement their inherent cultural, geographic, or resource advantages.

While countries should aim to maximize the efficiency of individual capitalist institutions, they must remember that it is specific combinations of these institutions, not adherence to dogmatic binaries, that produce thriving capitalist ecosystems. The GCI provides new understanding of these combinations, and in so doing can provide new insights on how capitalist systems work, and how they can work better.

UNDERSTANDING GLOBAL CAPITALISM

The GCI team set out to uncover which countries have the ultimate capitalist economies. However, we've arrived somewhere far more interesting. The rankings still matter. They show which countries have built the strongest systems and make it possible to compare them across countries and over time. Those rankings, however, are only the beginning.

The picture gets more detailed—and more interesting—once you look beneath the headline score. Breaking the GCI into its eight subindices shows what's really driving a country's performance. Germany, for example, is one of the world's most capitalist economies but has an unusually weak banking sector. China's surge in new business formation came alongside a sharp drop in the free flow of goods and capital. India has grown its GDP at a rapid rate, but declining institutions could suggest future problems. And in The Gambia, the GCI picked up on the immediate upswing of property rights after a long-term dictatorial regime collapsed. This comparative analytical potential is where the GCI provides real value. It moves beyond the league table, and opens up the black box behind it.

The GCI also lets us test some of the most prominent claims made about capitalism. Across thousands of country-year observations, stronger capitalist institutions correlate with lower inequality, higher levels of human development, stronger democratic institutions, and greater life satisfaction. They also appear in both high-tax and low-tax economies. None of that proves cause and effect. Yet it does give those debates a much firmer footing in evidence.

The varieties take the story another leap forward. They show that capitalism comes in many forms. Entrepreneurial, Corporate, Institutional, and Commercial Capitalism all cut across rich and poor countries, democracies and authoritarian states, advanced and developing economies alike. Switzerland and Nigeria belong to the same variety. Japan and the Democratic Republic of Congo belong to another. Many sit near the top of the standings despite getting there in completely different ways. In other words, strength and shape are two different things.

These insights turn one of the oldest arguments about capitalism on its head. For decades, public and academic debates alike have treated capitalism as a choice between government and market activity. The evidence here shifts the debate completely. What matters isn't the size of the state, but rather whether governments and businesses support open markets, new business creation, and robust competition — or constrain them. Governments can make markets work better by protecting property rights, promoting competitive environments, and integrating markets. Private actors can do the same — or they can choke market systems through monopoly, protecting vested interests, and erecting barriers to entry.

In the end, it is not simply about the scale of state involvement in the economy. It is about whether public and private institutions cooperate to support the institutional foundations that allow capital to be deployed as freely as possible.

IMPLICATIONS

FOR RESEARCHERS

The GCI provides a comprehensive and rigorous tool to evaluate the effect of capitalist institutions on subjective wellbeing, economic development, and institutional design. The GCI's composition from 8 independent subindices and overt separation from outcome variables allows scholars to study capitalism as a whole, or any of its 8 individual components, with minimal structural bias.

FOR POLICYMAKERS

The availability of 8 “free-standing” subindices allows for the identification of previously unobservable strengths and weaknesses in a nation's institutional structure. Since specific elements of the GCI (domains and subindices) have unique, statistically significant relationships with a wide range of output variables, we hope that policy makers can use the GCI to better target reforms and other policy decisions.

FOR BUSINESS LEADERS

Analysis of the GCI in its component elements can provide profound insights on institutional strength and risk management across the globe. The depth of the GCI's data inputs and robustness of its empirical model provide a means of cross-national comparison that has not previously existed. From in-country risk assessment to the development of financial products, the GCI holds tremendous possibilities for the private sector.

FOR THE PUBLIC

The GCI reveals that many countries considered “less capitalist” often have stronger capitalist institutions than nations commonly thought of as “more capitalist.” We hope to empower users to consider the nuance of capitalist systems and better understand their strengths and weaknesses.

In the end, the GCI is about much more than ranking countries. Looking past the overall score reveals how capitalist systems are put together, where they are strongest and weakest, how they evolve over time, and how they relate to wider economic and social outcomes.

This report establishes the fundamental architecture of capitalist systems. Future editions can and will explore different parts of that structure in greater depth, from democracy, innovation, trade, and sustainability across individual countries, regions, and the world at large.

2025 GLOBAL CAPITALISM INDEX RANKINGS

The 2025 Global Capitalism Index scores and ranks 175 countries across 8 subindices and the top-line GCI composite.

Global Capitalism Index, 2025

RANKING	COUNTRY	SCORE
